Fax: 716-961-1113

What is a FibroScan?

A FibroScan is a newer technique for diagnosing fatty liver disease that uses a specialized ultrasound-based machine to measure scarring and fat buildup in your liver. Like other ultrasound exams, FibroScan is painless, easy, and quick.

A FibroScan doesn't require any special preparation, although you are asked **not to eat or drink for 3 hours before the FibroScan.**

How does FibroScan work for fatty liver?

The buildup of fat cells in fatty liver disease causes inflammation and scarring, called fibrosis. One way of measuring the severity of fatty liver disease is to measure the fibrosis present in the liver. Fibrosis causes stiffness in the liver tissue.

FibroScan, also called transient elastography, measures the speed of ultrasound waves as they move through the liver. The ultrasound waves move at different speeds through normal liver tissue and areas of fibrosis.

Results of a FibroScan are sent to your doctor. Your doctor can interpret the results, and, together, you can make a plan for treatment or further testing, if needed.

To Order Fibroscan for your patient
Please Fax order **ATTN :Stephanie to 716-961-9113** along with
Demographic and insurance information.
Please reach out if any concerns or Questions to 716-961-9900
